On the Subject of Factoring

I thought factoring was easy...

Follow the tree and click the last letter with nothing under it.
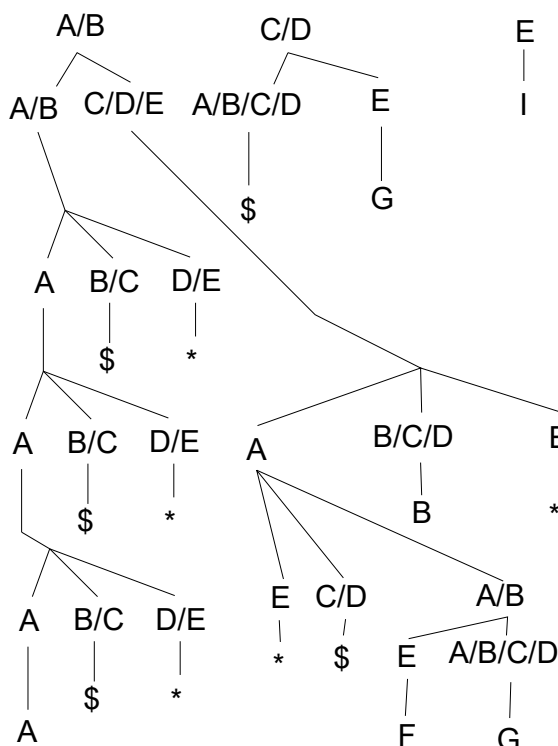

Special Symbols

- **$** Click the last letter of the code.
- ***** Click any letter you want.

The bar on the right shows what stage you are in. Once you complete three stages, you complete the module. If you click the wrong button in a stage, it will send you back to stage one and give you a strike. Remember that if there are certain ports (look below), your FINAL answer may change.

Example

AABBC: Go to the A/B on the first row, because the first letter of the code is an A. Then, go to the A/B row, because the second letter is also an A. Then you look on the bomb, and there is a DVI-D port, so your "A" becomes an "E". Then that leads you to what to click (E).

Tree   ## Ports

DVI-D - "A" => "E"

Parrallel - "E" => "I"

PS/2 - "G" => "I"

Serial - "A/B/C" => "F"
